ABSTRACT

This document describes the tasks in the hydrologic monitoring location visit workflow pertaining to collection of parameters (e.g., rainfall, groundwater levels and their associated equipment). The goal of this effort is to support the field or new efforts used to facilitate the field data collection process.

The workflow described here focuses on 1) collecting and verifying data for which Aquarius is the system of record and 2) recording water management and maintenance activities for the equipment used to collect that data. An example is used to describe the tasks in the workflow. The workflow is designed to be a generic template that can be adapted to other systems. The workflow steps include some elements specific to these systems.

The resulting effort is ongoing. Please contact the NWFWMD GIS team with comments or corrections.
