**ABSTRACT**

This document describes the tasks in the hydrologic monitoring location visit workflow pertaining to the collection of parameters (e.g., rainfall, groundwater levels) and their associated equipment. The goal of this effort is to support the field or site efforts used to facilitate the field data collection process.

The workflows described here focus on 1) collecting and entering data for which Aquarius is the system of record and 2) recording management and maintenance activities for the equipment used to collect that data. An example of a workflow is provided for each task. The workflows are intended to be used as a reference for the hydrologist and serve as the system of record for their management data, and a training tool for future content. Therefore, the workflow steps include some elements specific to these positions.

The resulting effort is ongoing. Please contact the NWFWMD GIS team with comments or corrections.
